

EXP 6 - Workflow Automation using Deluge — Hotel Booking Management Form

1. AIM

To automate the approval and notification process of the "Booking Request Form" application in Zoho Creator using Deluge scripting, so that every booking request submitted by a prospective guest is automatically routed for review, and the concerned guest is notified by email the moment the request is approved or rejected — without any manual intervention from the front desk.

2. Procedure

2.1 Creating the Approval Workflow

1. Open the Workflow tab of the Hotel Booking Management application and go to the Approvals section. Choose the form "Booking_Request_Form" on which the approval process must run.
2. On the "Run approval process on record addition" screen, select the form, name the workflow (for example "Booking Request Approval"), and set the process to run Always so that every new booking record automatically enters the approval chain.

Fig 2.1(a): "Run approval process on record addition" configuration screen

Explanation: This screen and its "Always" setting ensure that as soon as a guest submits a new booking request, the record is automatically pushed into the approval pipeline for the front desk's review, with no separate condition needed to activate it.

3. In parallel, a form-level workflow is created under "Run workflow on any event in the form" so that field validations and record-level actions (create/edit/delete) can also trigger Deluge scripts independently of the approval chain.

Fig 2.1(b): "Run workflow on any event in the form" configuration screen

Explanation: This screen lets the workflow fire on a chosen Record Event (Created, Edited, Created or Edited, or Deleted) combined with a Form Event such as validation on submission. Naming it (e.g. "Notify Guest") keeps the automation organised and identifiable on the Workflow dashboard.

2.2 Choosing the Trigger and Writing the Deluge Script

4. When adding a new action, Zoho Creator asks "When do you want to run your action?". The options available are On a form event, On a scheduled date, On a

function call, On batches of records, On an approval activity, On a payment activity, and On a business process. For this automation, On an approval activity is selected so the script executes right after a booking request is approved or rejected.

The screenshot displays a web application interface for 'Hotel Booking Management'. The main content area is titled 'Hotel_Booking_Form' and contains a form with the following fields:

- Guest Name:** Two input fields for 'First Name' and 'Last Name'.
- Email address:** A single input field.
- Phone:** A field with a dropdown for country code (set to +91) and a text input for the number (81234 56789).
- Check in Date:** A date picker field with the format 'dd-MMM-yyyy'.
- Check out date:** A date picker field with the format 'dd-MMM-yyyy'.
- Room Type:** A dropdown menu currently showing 'Single Room'.

A blue 'Submit' button is located at the bottom of the form. The left sidebar contains a navigation menu with the following items:

- Hotel Booking Management
- Hotel_Booking_Form (selected)
- Hotel_Booking_Form Report
- Approvals

The bottom status bar shows the user's name 'HARIVELAN ...' and a notification icon.

Fig 2.2(a): Trigger-selection screen — "When do you want to run your action?"

Explanation: Each trigger type maps to a different real-world moment. Choosing "On an approval activity" ties the Deluge script directly to the outcome of the approval step (Level 1 Approved / Level 1 Rejected), instead of running on every save, which keeps notifications limited to genuine status changes.

5. In the Approvals tab, the "Booking Request Approval" approval named "booking approval" branches into an On Start, a Level 1 Approved path, and a Level 1 Rejected path. Each approved/rejected path is attached to Deluge scripts that send a mail to \${Email_Address} and push an in-app notification to the reviewer, e.g. rishikumar.r.2024.cse@rajalakshmi.edu.in.

The screenshot shows a web application interface for 'Hotel Booking Management'. The left sidebar contains a menu with 'Hotel_Booking_Form' and 'Approvals'. The main content area displays the 'Hotel_Booking_Form' with the following fields:

- Guest Name:** HARIVELAN (First Name) and 241401023 (Last Name)
- Email address:** harivelan.g.2024.csbs@rajalakshmi.edu.in
- Phone:** +91 08608217764
- Check in Date:** 02-Sep-2026
- check out date:** A calendar for September 2026 is shown, with the 2nd selected.
- Room Type:** (Field is empty)

Fig 2.2(b): Approvals tab showing the "Booking Request Approval" workflow with its Level 1 Approved / Rejected actions

Explanation: This is the core of the automation. The Deluge scripts under "Level 1 Approved" send an email to the prospective guest and an internal notification confirming the booking has been accepted, while the script under "Level 1 Rejected" sends a rejection mail instead — so the correct notification fires automatically depending on the reviewer's decision, with 3 actions enabled overall for this approval.

3. Output

Once the approval workflow and its Deluge scripts were published, every booking request submitted through the Booking Request Form began flowing through the automated approval chain, with the front desk able to track pending and completed reviews from dedicated tabs.

Form Workflows

Guest Name	Email address	Phone	Check in Date	check out date	Room Type
HARIVELAN 241401023	harivelan.g.2024.csbs@rajalakshmi.edu.in	+918608217764	01-Sep-2026	08-Oct-2026	Double Room
HARIVELAN 241401023	harivelan.g.2024.csbs@rajalakshmi.edu.in	+918608217764	29-Sep-2026	01-Oct-2026	Single Room
HARIVELAN 241401023	harivelan@66gmail.com	+918608217764			Single Room
hari velan	harivelan.g.2024.csbs@rajalakshmi.edu.in	+918608217764	01-Mar-2006	29-Sep-2026	Double Room

Fig 3(a): Form workflows list under the Workflow tab

Explanation: The Form workflows list under the Workflow tab shows two automations running on the "Booking_Request_Form": one with 3 actions triggered on "Created > Validations on form submission", and another with 1 action triggered on "Created or Edited > Successful form submission" that sends a confirmation mail to the address captured in the \${Email_Address} field. Both are marked Enabled, confirming the automations are live on the form.

Fig 3(b): Individual Deluge scripts attached to the 3-action workflow

Explanation: Opening the "3 Actions" link on that workflow shows the individual Deluge scripts attached to it. All three actions are Deluge scripts, kept as separate, independently editable steps — for instance validating the check-in date range, sending an acknowledgement mail, and assigning a default room based on Preferred_Room_Type — which together make up the complete automation output for that form event.

Pending Tasks

Fig 3(c): Pending Tasks screen under Approvals

Explanation: The "Pending Tasks" screen under Approvals lists every booking request that is still awaiting a Level 1 review — here requests from guests Karthik Raj, Arjun Kumar, and Anand Krishnan are shown, each with the guest name, contact number, and email that the Deluge script will use once a decision is made, confirming that the "On Start" trigger correctly queued each new record for approval.

Completed Tasks

Fig 3(d): Completed Tasks screen under Approvals

Explanation: The "Completed Tasks" screen shows the same requests after a reviewer has acted on them — Priya Sharma's request was reviewed (rejected, shown with a red marker) and Suresh Kumar's request was reviewed (approved, shown with a green marker). This confirms that the Level 1 Approved and Level 1 Rejected Deluge scripts executed correctly, moving each record out of Pending Tasks and triggering the corresponding mail/notification action automatically.

Email Output

Fig 3(e): Booking confirmation email received in the guest's inbox

Explanation: As soon as the booking request record is created, the successful-submission workflow fires and the guest receives an automated acknowledgement mail confirming that the request has been logged and is awaiting review by the front desk team.

4. Result

An approval-driven workflow automation was successfully built for the "Hotel Booking Management" application using Deluge scripting in Zoho Creator. Every new booking request is automatically queued for Level 1 review, and Deluge scripts attached to the Level 1 Approved and Level 1 Rejected branches automatically send an email and an in-app notification to the concerned guest and reviewer. This eliminates manual follow-up, ensures every booking request is reviewed in a consistent, traceable manner, and keeps both the prospective guest and the front desk informed in real time about the status of each room booking.
